

My current approach:

My approach to engineering design is shaped by my understanding of balance, structure, and iteration, principles I developed through ballet and now directly apply within the engineering design process (frame, diverge, converge, realise)

In practice, that means i begin by carefully framing problems, identifying constraints, user needs, and system interactions before jumping to solutions. For example, in for the civ project, I focused on how forces, movement, and interactions within a system affected the overall performance before deciding on a specific cross-section. Similar to how a dancer must find alignment before movement, I prioritize understanding how different forces and components interact within a system.

THERE IS A DIVINE BEAUTY IN LEARNING

A music box with a picture of me as a kid dancing: proof that no box can define who you are

My experiences:

My background in ballet has influenced not only how I think about systems, but also how I communicate and iterate within engineering design.

Because I am not always comfortable expressing ideas verbally, I have developed a more visual approach to communication. I use sketches, diagrams, and spatial representations to explain how components interact within a system. This allows me to contribute effectively to team discussions by making ideas more tangible and easier to evaluate. This approach also supports my iterative process. By visualising designs early, I can identify potential issues and refine solutions before physical prototyping, leading to more efficient and intentional design decisions.

This perspective helps me remain attentive to the different facets of engineering design, allowing me to approach problems with discipline, creativity, and intention.

MY VALUES AND BELIEFS:

My design practice is guided by creativity and collaboration, but more importantly, by how these values shape my decisions and actions within projects.

Creativity.

It's not only about generating ideas, but about exploring multiple solution pathways and reframing problems from different perspectives. In my design work, I use sketching and visual prototyping to compare different system configurations. This allowed me to identify potential issues early, such as conflicts between components or inefficiencies in the integrated system, like in our Praxis 2 design, and refine ideas before committing to a final design. At the same time, I grounded these ideas using measurable criteria such as efficiency, safety, and user interaction. This ensures that my solutions are not only innovative but also feasible and effective within real-world constraints.

Collaboration.

In the art of Dance, no performance exists in isolation; it depends on the dancers, teachers, choreographers, and the orchestra. This has shaped how I approach design work. I value listening to others, integrating feedback, and contributing ideas in a way that helps the team. These values matter because they make design work not just effective, but also human and fun.
